

Sample Project Documentation

Date	29 September 2026
Team ID	TBD
Project Name	PocketSmart AI
Maximum Marks	4 Marks

1. Project Overview

PocketSmart AI is a web-based smart budget and recommendation assistant that helps users track expenses, manage monthly budgets, set savings goals, visualize spending, scan receipts, export transaction data, and receive AI-assisted financial recommendations.

2. Objectives

- Centralize expense tracking.
- Help users understand spending patterns.
- Connect budgets and savings goals with actual activity.
- Provide optional AI-assisted guidance and receipt extraction.
- Provide exportable transaction data.

3. Target Users

Students, young professionals and budget-conscious individuals who want a simple personal-finance dashboard.

4. Key Features

User Registration/Login, Expense Tracking, Spending Analytics, Budget Management, Savings Goals, AI Recommendations, Receipt OCR, CSV Export, Dark/Light Mode.

5. Technical Stack

Python, Flask, HTML, CSS, JavaScript, SQLite, optional PostgreSQL, Chart.js and Google Gemini.

6. Security

The application includes password hashing, JWT verification, authenticated endpoints, security response headers and an in-memory rate limiter. Secrets should be provided through environment configuration rather than committed to source control.

7. Limitations

AI functionality depends on API availability and configuration. The current rate limiter is in-memory, and the default SQLite database is intended for lightweight use. Production deployment should add hardened secret management, stronger session/token practices, monitoring and production-grade database configuration.

8. Future Scope

Bank/UPI integrations, recurring expenses, smarter alerts, advanced forecasting, multilingual support, PWA/mobile support, cloud deployment and deeper personalization.
